Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work. In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see the following URL: www.iso.org/iso/foreword.html.

This eighth edition cancels and replaces the seventh edition (ISO/IEC 9594-2:2014), which has been technically revised.

This document was prepared by ISO/IEC JTC 1, *Information technology*, SC 6, *Telecommunications and information exchange between systems*, in collaboration with ITU-T. The identical text is published as ITU-T X.501 (10/2016).

A list of all parts in the ISO/IEC 9594 series, published under the general title *Information technology — Open Systems Interconnection — The Directory*, can be found on the ISO website.

SECTION 11 – DSA OPERATIONAL FRAMEWORK	140
25 Overview	140
25.1 Definitions	140
25.2 Introduction	140
26 Operational bindings	140
26.1 General	140
26.2 Application of the operational framework	141
26.3 States of cooperation	142
27 Operational binding specification and management	143
27.1 Operational binding type specification	143
27.2 Operational binding management	144
27.3 Operational binding specification templates	145
28 Operations for operational binding management	147
28.1 Application-context definition	147
28.2 Establish Operational Binding operation	147
28.3 Modify Operational Binding operation	150
28.4 Terminate Operational Binding operation	152
28.5 Operational Binding Error	153
28.6 Operational Binding Management Bind and Unbind	155
SECTION 12 – INTERWORKING WITH LDAP	156
29 Overview	156
29.1 Definitions	156
29.2 Introduction	156
30 LDAP interworking model	156
30.1 LDAP interworking scenarios	156
30.2 Overview of bound DSA handling LDAP operations	157
30.3 General LDAP requestor characteristics	157
30.4 LDAP extension mechanisms	158
31 LDAP specific system schema	158
31.1 Operational Attribute types from IETF RFC 4512	158
Annex A – Object identifier usage	161
Annex B – Information framework in ASN.1	165
Annex C – Subschema administration in ASN.1	177
Annex D – Service administration in ASN.1	182
Annex E – Basic Access Control in ASN.1	186
Annex F – DSA operational attribute types in ASN.1	190
Annex G – Operational binding management in ASN.1	193
Annex H – Enhanced security in ASN.1	198

	<i>Page</i>
Annex I – LDAP system schema	201
Annex J – The mathematics of trees	203
Annex K – Name design criteria.....	204
Annex L – Examples of various aspects of schema.....	206
L.1 Example of an attribute hierarchy	206
L.2 Example of a subtree specification.....	206
L.3 Schema specification.....	207
L.4 DIT content rules.....	208
L.5 DIT context use	209
Annex M – Overview of basic access control permissions.....	210
M.1 Introduction	210
M.2 Permissions required for operations	210
M.3 Permissions affecting error.....	211
M.4 Entry level permissions	211
M.5 Entry level permissions	212
Annex N – Examples of access control	213
N.1 Introduction	213
N.2 Design principles for Basic Access Control.....	213
N.3 Introduction to example	214
N.4 Policy affecting the definition of specific and inner areas	215
N.5 Policy affecting the definition of Directory Access Control Domains (DACDs)	216
N.6 Policy expressed in prescriptiveACI attributes	219
N.7 Policy expressed in subentryACI attributes	224
N.8 Policy expressed in entryACI attributes	225
N.9 ACDF examples	225
N.10 Rule-based access control	227
Annex O – DSE type combinations	228
Annex P – Modelling of knowledge	230
Annex Q – Subfilters	235
Annex R – Compound entry name patterns and their use.....	236
Annex S – Naming concepts and considerations	238
S.1 History tells us	238
S.2 A new look at name resolution.....	238
Annex T – Alphabetical index of definitions.....	244
Annex U – Amendments and corrigenda.....	247

Introduction

This Recommendation | International Standard, together with other Recommendations in the ITU-T X.500-series | parts of ISO/IEC 9594, has been produced to facilitate the interconnection of information processing systems to provide directory services. A set of such systems, together with the directory information that they hold, can be viewed as an integrated whole, called the *Directory*. The information held by the Directory, collectively known as the Directory Information Base (DIB), is typically used to facilitate communication between, with or about objects such as application entities, people, terminals and distribution lists.

The Directory plays a significant role in Open Systems Interconnection (OSI), whose aim is to allow, with a minimum of technical agreement outside of the interconnection standards themselves, the interconnection of information processing systems:

- from different manufacturers;
- under different managements;
- of different levels of complexity; and
- of different ages.

This Recommendation | International Standard provides a number of different models for the Directory as a framework for the other Recommendations in the ITU-T X.500 series | parts of ISO/IEC 9594. The models are the overall (functional) model; the administrative authority model, generic Directory Information Models providing Directory User and Administrative User views on Directory information, generic DSA and DSA information models, an Operational Framework and a security model.

The generic Directory Information Models describe, for example, how information about objects is grouped to form Directory entries for those objects and how that information provides names for objects.

The generic DSA and DSA information models and the Operational Framework provide support for Directory distribution.

This Recommendation | International Standard provides a specialization of the generic Directory Information Models to support Directory Schema administration.

This Recommendation | International Standard provides the foundation frameworks upon which industry profiles can be defined by other standards groups and industry forums. Many of the features defined as optional in these frameworks may be mandated for use in certain environments through profiles. This eighth edition technically revises and enhances the seventh edition of this Recommendation | International Standard.

This eighth edition specifies versions 1 and 2 of the Directory protocols.

The first and second editions specified only version 1. Most of the services and protocols specified in this edition are designed to function under version 1. However, some enhanced services and protocols, e.g., signed errors, will not function unless all Directory entities involved in the operation have negotiated version 2. Whichever version has been negotiated, differences between the services and between the protocols defined in this eighth edition, except for those specifically assigned to version 2, are accommodated using the rules of extensibility defined in Rec. ITU-T X.519 | ISO/IEC 9594-5.

Annex A, which is an integral part of this Recommendation | International Standard, summarizes the usage of ASN.1 object identifiers in the ITU-T X.500-series Recommendations | parts of ISO/IEC 9594.

Annex B, which is an integral part of this Recommendation | International Standard, provides the ASN.1 module which contains all of the definitions associated with the information framework.

Annex C, which is an integral part of this Recommendation | International Standard, provides the subschema administration schema in ASN.1.

Annex D, which is an integral part of this Recommendation | International Standard, provides the ASN.1 module for Service Administration.

Annex E, which is an integral part of this Recommendation | International Standard, provides the ASN.1 module for Basic Access Control.

Annex F, which is an integral part of this Recommendation | International Standard, provides the ASN.1 module which contains all the definitions associated with DSA operational attribute types.

Annex G, which is an integral part of this Recommendation | International Standard, provides the ASN.1 module which contains all the definitions associated with operational binding management operations.

Annex H, which is an integral part of this Recommendation | International Standard, provides the ASN.1 module which contains all the definitions associated with enhanced security.

Annex I, which is an integral part of this Recommendation | International Standard, provides the ASN.1 module which contains the definitions for LDAP system schema using the ASN.1 ATTRIBUTE information object.

Annex J, which is not an integral part of this Recommendation | International Standard, summarizes the mathematical terminology associated with tree structures.

Annex K, which is not an integral part of this Recommendation | International Standard, describes some criteria that can be considered in designing names.

Annex L, which is not an integral part of this Recommendation | International Standard, provides some examples of various aspects of Schema.

Annex M, which is not an integral part of this Recommendation | International Standard, provides an overview of the semantics associated with Basic Access Control permissions.

Annex N, which is not an integral part of this Recommendation | International Standard, provides an extended example of the use of Basic Access Control.

Annex O, which is not an integral part of this Recommendation | International Standard, describes some DSA specific entry combinations.

Annex P, which is not an integral part of this Recommendation | International Standard, provides a framework for the modelling of knowledge.

Annex Q, which is not an integral part of this Recommendation | International Standard, describes the concept of subfilters.

Annex R, which is not an integral part of this Recommendation | International Standard, describes recommendations and examples on how family members can be named.

Annex S, which is not an integral part of this Recommendation | International Standard, gives an introduction to naming concepts and considerations.

Annex T, which is not an integral part of this Recommendation | International Standard, lists alphabetically the terms defined in this Recommendation | International Standard.

Annex U, which is not an integral part of this Recommendation | International Standard, lists the amendments and defect reports that have been incorporated to form this edition of this Recommendation | International Standard.

INTERNATIONAL STANDARD
ITU-T RECOMMENDATION

**Information technology – Open Systems Interconnection –
The Directory: Models**

SECTION 1 – GENERAL

1 Scope

The models defined in this Recommendation | International Standard provide a conceptual and terminological framework for the other ITU-T X.500-series Recommendations | parts of ISO/IEC 9594 which define various aspects of the Directory.

The functional and administrative authority models define ways in which the Directory can be distributed, both functionally and administratively. Generic Directory System Agent (DSA) and DSA information models and an Operational Framework are also provided to support Directory distribution.

The generic Directory Information Models describe the logical structure of the Directory Information Base (DIB) from the perspective of Directory and Administrative Users. In these models, the fact that the Directory is distributed, rather than centralized, is not visible.

This Recommendation | International Standard provides a specialization of the generic Directory Information Models to support Directory Schema administration.

The other ITU-T Recommendations in the X.500 series | parts of ISO/IEC 9594 make use of the concepts defined in this Recommendation | International Standard to define specializations of the generic information and DSA models to provide specific information, DSA and operational models supporting particular directory capabilities (e.g., Replication):

- a) the service provided by the Directory is described (in Rec. ITU-T X.511 | ISO/IEC 9594-3) in terms of the concepts of the information framework: this allows the service provided to be somewhat independent of the physical distribution of the DIB;
- b) the distributed operation of the Directory is specified (in Rec. ITU-T X.518 | ISO/IEC 9594-4) so as to provide that service, and therefore maintain that logical information structure, given that the DIB is in fact highly distributed;
- c) replication capabilities offered by the component parts of the Directory to improve overall Directory performance are specified (in Rec. ITU-T X.525 | ISO/IEC 9594-9).

The security model establishes a framework for the specification of access control mechanisms. It provides a mechanism for identifying the access control scheme in effect in a particular portion of the Directory Information Tree (DIT), and it defines three flexible, specific access control schemes which are suitable for a wide variety of applications and styles of use. The security model also provides a framework for protecting the confidentiality and integrity of directory operations using mechanisms such as encryption and digital signatures. This makes use of the framework for authentication defined in Rec. ITU-T X.509 | ISO/IEC 9594-8 as well as generic upper layers security tools defined in Rec. ITU-T X.830 | ISO/IEC 11586-1.

DSA models establish a framework for the specification of the operation of the components of the Directory. Specifically:

- a) the Directory functional model describes how the Directory is manifested as a set of one or more components, each being a DSA;
- b) the Directory distribution model describes the principals according to which the DIB entries and entry-copies may be distributed among DSAs;
- c) the DSA information model describes the structure of the Directory user and operational information held in a DSA;
- d) the DSA operational framework describes the means by which the definition of specific forms of cooperation between DSAs to achieve particular objectives (e.g., shadowing) is structured.
