## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see [www.iso.org/directives](http://www.iso.org/directives)).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see [www.iso.org/patents](http://www.iso.org/patents)).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see [www.iso.org/iso/foreword.html](http://www.iso.org/iso/foreword.html).

This document was prepared by Technical Committee ISO/TC 204, *Intelligent transport systems*.

A list of all parts in the ISO 13111 series can be found on the ISO website.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at [www.iso.org/members.html](http://www.iso.org/members.html).

## Introduction

This document defines the data exchange protocol between personal ITS stations and other ITS stations which are used to implement the use case defined in ISO 13111-1.

This document defines protocol based on the data exchange message (DXM) at application level between personal ITS stations and other ITS stations, such as vehicle ITS stations, central ITS stations, roadside ITS stations, etc.

Applications supporting ITS service provisions and multimedia use via personal ITS stations need to harmonize with existing or developing documents in the relevant areas. These applications can be implemented using vehicle information, driver advisory systems, warning systems, entertainment systems, traffic information, public transport information, slow transportation system (non-motorized travel) information and multimodal navigation services based on the communication architecture and protocol defined in ISO/TR 13185-1 and other related documents listed below:

- the ISO 13185 series, defining the vehicle interface for provisioning and support of ITS services;
- ISO 19132, ISO 19133 and ISO 19134, defining the conceptual schema of location-based services, tracking and navigation services, and multimodal navigation services;
- the ISO 15031 series, defining emissions-related diagnostic data supported by vehicles in all countries requiring on-board diagnostics (OBD) compliance;
- ISO 22900-2, defining the modular vehicle communication interface (MVCI) diagnostic protocol data unit (D-PDU API) to separate the protocol data unit (PDU) from vehicle-specific protocols;
- the ISO 22902 series,<sup>1)</sup> defining provisions for multimedia and telematics based on automotive multimedia interface collaboration (AMI-C) specifications and reference documents for the automotive industry. The important logical element of the architecture is a vehicle interface;
- ISO 22837, defining the reference architecture for probe vehicle systems and a basic data framework for probe data;
- the ISO 27145 series, defining diagnostic data (emissions-related systems, future safety-related systems, etc.) to be supported by vehicles in all countries implementing the GTR (Global Technical Regulation) into their local legislation;
- ISO/TS 29284, defining the standardization of information, communication and control systems in the field of urban and rural surface transport, including intermodal and multimodal aspects thereof, traveller information, traffic management, public transport, commercial transport, emergency services and commercial services in the ITS field;
- SAE J2735, defining the support of interoperability among dedicated short-range communication (DSRC) applications through the use of standardized message sets, data frames and data elements.

# Intelligent transport systems (ITS) — The use of personal ITS stations to support ITS service provision for travellers —

## Part 2: General requirements for data exchange between ITS stations

### 1 Scope

This document defines the data exchange protocol used to implement use cases for applications based on the personal ITS station defined in ISO 13111-1, which provides and maintains ITS services to travellers, including drivers, passengers and pedestrians.

The ITS applications supported by this document include multimodal transportation information services and multimodal navigation services that are based on personal ITS stations in various application scenarios defined in ISO 13111-1.

The use case implementations described in this document refer to the architecture defined in ISO 21217 and ISO 13184.

### 2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 15031-2, *Road vehicles — Communication between vehicle and external equipment for emissions-related diagnostics — Part 2: Guidance on terms, definitions, abbreviations and acronyms*

### 3 Terms, definitions and abbreviated terms

#### 3.1 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO 15031-2 and the following apply.

ISO and IEC maintain terminology databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at <https://www.iso.org/obp>
- IEC Electropedia: available at <https://www.electropedia.org/>

##### 3.1.1

##### **central ITS station**

##### **C-ITS-S**

implementation of an ITS station in a central ITS subsystem

##### 3.1.2

##### **ITS service**

service provided by a set of ITS station applications
