ATIS Standard on -

Recommendations for Extensions to Indoor Test Methodology

As a leading technology and solutions development organization, the Alliance for Telecommunications Industry Solutions (ATIS) brings together the top global ICT companies to advance the industry's most pressing business priorities. ATIS' nearly 200 member companies are currently working to address the All-IP transition, 5G, network functions virtualization, big data analytics, cloud services, device solutions, emergency services, M2M, cyber security, network evolution, quality of service, billing support, operations, and much more. These priorities follow a fast-track development lifecycle — from design and innovation through standards, specifications, requirements, business use cases, software toolkits, open source solutions, and interoperability testing.

ATIS is accredited by the American National Standards Institute (ANSI). The organization is the North American Organizational Partner for the 3rd Generation Partnership Project (3GPP), a founding Partner of the oneM2M global initiative, a member of the International Telecommunication Union (ITU), as well as a member of the Inter-American Telecommunication Commission (CITELE). For more information, visit www.atis.org.

Notice of Disclaimer & Limitation of Liability

The information provided in this document is directed solely to professionals who have the appropriate degree of experience to understand and interpret its contents in accordance with generally accepted engineering or other professional standards and applicable regulations. No recommendation as to products or vendors is made or should be implied.

NO REPRESENTATION OR WARRANTY IS MADE THAT THE INFORMATION IS TECHNICALLY ACCURATE OR SUFFICIENT OR CONFORMS TO ANY STATUTE, GOVERNMENTAL RULE OR REGULATION, AND FURTHER, NO REPRESENTATION OR WARRANTY IS MADE OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE OR AGAINST INFRINGEMENT OF INTELLECTUAL PROPERTY RIGHTS. ATIS SHALL NOT BE LIABLE, BEYOND THE AMOUNT OF ANY SUM RECEIVED IN PAYMENT BY ATIS FOR THIS DOCUMENT, AND IN NO EVENT SHALL ATIS BE LIABLE FOR LOST PROFITS OR OTHER INCIDENTAL OR CONSEQUENTIAL DAMAGES. ATIS EXPRESSLY ADVISES THAT ANY AND ALL USE OF OR RELIANCE UPON THE INFORMATION PROVIDED IN THIS DOCUMENT IS AT THE RISK OF THE USER.

NOTE - The user's attention is called to the possibility that compliance with this standard may require use of an invention covered by patent rights. By publication of this standard, no position is taken with respect to whether use of an invention covered by patent rights will be required, and if any such use is required no position is taken regarding the validity of this claim or any patent rights in connection therewith. Please refer to [<http://www.atis.org/legal/patentinfo.asp>] to determine if any statement has been filed by a patent holder indicating a willingness to grant a license either without compensation or on reasonable and non-discriminatory terms and conditions to applicants desiring to obtain a license.

Recommendations for Extensions to Indoor Test Methodology

Alliance for Telecommunications Industry Solutions

Approved June 25, 2018

Abstract

This document provides recommendations specific to horizontal accuracy testing within the framework of the 9-1-1 Location Technologies Test Bed. It should be viewed as an extension to ATIS-0500031.v002, *Test Bed and Monitoring Regions Definition and Methodology*.

Foreword

The Alliance for Telecommunications Industry Solutions (ATIS) serves the public through improved understanding between carriers, customers, and manufacturers. The Emergency Service Interconnection Forum (ESIF) provides a forum to facilitate the identification and resolution of technical and/or operational issues related to the interconnection of wireline, wireless, cable, satellites, Internet, and emergency services networks.

The mandatory requirements are designated by the word *shall* and recommendations by the word *should*. Where both a mandatory requirement and a recommendation are specified for the same criterion, the recommendation represents a goal currently identifiable as having distinct compatibility or performance advantages. The word *may* denotes an optional capability that could augment the standard. The standard is fully functional without the incorporation of this optional capability.

Suggestions for improvement of this document are welcome. They should be sent to the Alliance for Telecommunications Industry Solutions, ESIF, 1200 G Street NW, Suite 500, Washington, DC 20005.

At the time of consensus on this document, ESIF, which was responsible for its development, had the following leadership:

- R. Hixson, ESIF Chair (NENA)
- R. Marshall, ESIF 1st Vice Chair (Comtech)
- J. Green, ESIF 2nd Vice Chair, ESIF ESM Co-Chair (Sprint)
- K. Springer, ESIF ESM Co-Chair (AT&T)

The **Emergency Services & Methodologies (ESM)** Subcommittee was responsible for the development of this document.

Table of Contents

1	Scope, Purpose, & Application	1
1.1	Scope	1
1.2	Purpose	1
1.3	Application	1
2	Normative References	1
3	Definitions, Acronyms, & Abbreviations	2
3.1	Definitions	2
3.2	Acronyms & Abbreviations	3
4	Description of the Problem	3
5	Goals of the Methodology Extensions	4
6	Approaches	5
6.1	Approaches to Achieve Increased Positional Diversity, Orientation Diversity, & Motion	5
6.2	Approach #1: Substantially Increased Number of Static Test Locations	6
6.2.1	Test Point Spacing	7
6.2.2	Orientation Randomization	7
6.2.3	Desired Number of Test Points	7
6.2.4	Number of Test Calls	8
6.2.5	Motion Between Test Points	8
6.2.6	Determining Ground Truth for Test Points Along Test Routes	9
6.3	Approach #2: Testing with Pedestrian Motion along Predefined Routes	10
6.3.1	Route Length, Duration, & Number of Test Calls	10
6.3.2	Time of Applicability	11
6.3.3	Accuracy of Ground Truth in Approach #2	11
6.4	Required Ground Truth Accuracy	12
6.5	Test Point Selection and Documentation Strategies	12
6.5.1	Referenceable Objects Defined	13
6.5.2	Associating Test Points & Referenceable Objects	13
6.5.3	Documenting Test Points & Referenceable Objects	14
6.5.4	The Point Selection Process	14
6.5.5	Leveraging the Same Point on Multiple Floors	14
7	Required Tools	14
7.1	Tool Features	15
7.1.1	Test Point Time Capture & Route Management Tool Feature for Approach #1	16
7.1.2	Test Point Time Capture & Route Management Tool Feature for Approach #2	17
7.1.3	Test Device Controller Tool Feature	18
7.1.4	Data Processing Tool Feature	18
7.1.5	Test Point & Route Generation Tool Feature	19
8	Recommendations	21
A	Simple Referential Ground Truth Calculation Methods	22
B	Confidence Intervals for Proportions in the Context of Test Calls	24
C	Summary of Experiments Used to Estimate Error Sources for Pedestrian Motion Ground Truth	25
D	State of the Art for Indoor Maps	27

ATIS Standard on –

Recommendations for Extensions to Indoor Test Methodology

1 Scope, Purpose, & Application

1.1 Scope

This document provides extensions to the indoor test methodology adopted in ATIS-0500022 (which was based on ATIS-0500013) and subsequently in ATIS-0500031, wherein indoor testing consisted of placing repeated stationary test calls at a handful of accurately surveyed test points inside each test building. The rationale, goals, and principles of the indoor test methodology extensions, as well as the tools required are presented and described with recommendations regarding the application of the methodology extensions to indoor accuracy testing. How the described methodology extensions can supplement existing indoor test methodology is also discussed.

Note that this document focuses exclusively on horizontal accuracy testing. Vertical accuracy testing is addressed in ATIS-0500030.

1.2 Purpose

The purpose of this set of guidelines and recommendations is to provide those engaged in testing the indoor performance of wireless location systems for 9-1-1 with a standardized, practical approach to mitigating some of the shortcomings of the indoor test methodology used so far. That methodology is susceptible to delivering results from samples where the consecutive collocated test calls are not independent due to various factors, including device memory. This situation is becoming more common in a range of newer handsets and technology implementations and can result in loss of statistical independence between successive test calls when testing indoors.

1.3 Application

This document is intended to be applied in future test campaigns undertaken by the 9-1-1 Indoor Location Technologies Test Bed, or independently by wireless carriers or location technology vendors. This applies particularly to test campaigns that focus on latitude, longitude, and possibly altitude, in which the handsets under test are expected to exhibit inter-dependence between consecutive collocated test calls – e.g., devices that implement a flavor of Device Based Hybrid (DBH). DBH refers to a class of User Equipment (UE)-based techniques where a location fix is generated using any combination of available location methods including Global Positioning System (GPS)/Assisted Global Positioning System (AGPS), positioning based on the presence of Wi-Fi and other beacons, and sensor-assisted positioning. This extended methodology is not intended to replace the existing indoor test methodology but rather supplement it.

2 Normative References

The following standards contain provisions which, through reference in this text, constitute provisions of this Standard. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on this Standard are encouraged to investigate the possibility of applying the most recent editions of the standards indicated below.
