Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the WTO principles in the Technical Barriers to Trade (TBT) see the following URL: [Foreword - Supplementary information](#)

The committee responsible for this document is ISO/TC 71, *Concrete, reinforced concrete and pre-stressed concrete*, Subcommittee SC 1, *Test methods for concrete*.

ISO 17785 consists of the following parts, under the general title *Testing methods for pervious concrete*:

— *Part 1: Infiltration rate*

Testing methods for pervious concrete —

Part 1: Infiltration rate

1 Scope

This part of ISO 17785 specifies the procedure for testing the infiltration rate of hardened pervious concrete pavement specimens in the laboratory. It is not a method for measuring the permeability of pervious concrete. The specimens can either be prepared in the laboratory or cored from field placements, but not representing field conditions. This part of ISO 17785 also specifies procedures to make and cure hardened pervious concrete samples in the laboratory.

2 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

2.1

infiltration rate

water flow rate per area per time through pervious concrete

2.2

pervious concrete

concrete which has interconnected voids that allow for water flow through them

Note 1 to entry: Pervious concrete for pavement is usually made with little or no fine aggregate and contains narrowly graded coarse aggregate typically with the nominal maximum size of 10 mm. The nominal size can be less or more, but the nominal maximum size is 25 mm.

2.3

pre-wet

wetting specimens before test representing field conditions with antecedent precipitation

Note 1 to entry: This pre-wet condition typically represents the condition of the minimum flow rate.

3 Symbols

k infiltration rate (mm/s)

W volume of infiltrated water (mm³)

A cross-sectional area of specimen (mm²)

t time required for measured volume of water to infiltrate the concrete (s)

4 Principle

The test specimens are pre-wetted before the test. A given amount of water is poured into the specimen and the time for the water to infiltrate is measured.
